

ARTYOM NESIN

Backend Engineer · TypeScript / Node.js / NestJS / Vue 3

Almaty, Kazakhstan (based in Batumi, Georgia until December 2026) · artyom@nesin.dev · [LinkedIn](#) · [GitHub](#) · [nesin.dev](#) · [Telegram](#)
Citizenship: Kazakhstan · Russian (native) · English (B2) · Kazakh (beginner)

SUMMARY

Backend engineer with four years of commercial experience in TypeScript, Node.js, NestJS and Vue 3. I designed and shipped three production systems for a large retail / q-commerce client, including a lead deduplication pipeline running at around 600 requests per minute with peaks near 2,000, and a shift-scheduling platform with a time tracker embedded directly into a third-party SaaS interface.

I take projects from the first commit to production: API design, data modelling, queues, caching, deployment and incident response. I am especially comfortable working against rate-limited third-party APIs — queues, idempotency, caching, retries. I also run code reviews and mentor inside the team.

Looking for a Senior Backend Engineer or Tech Lead role with ownership of system design and technical direction.

TECH

Languages: TypeScript, JavaScript, SQL

Backend: Node.js, NestJS, REST APIs, WebSockets, JWT, OAuth

Frontend: Vue 3, Vue Router, Pinia, reusable component libraries

Databases: PostgreSQL, Redis, MySQL, MariaDB, MS SQL

ORMs: Prisma, TypeORM, Drizzle, raw SQL

Queues and messaging: BullMQ, RabbitMQ, Redis Pub/Sub

Infrastructure: Docker, docker-compose, Kubernetes (basic), GitLab CI/CD, VPS administration, Vercel, Railway

Observability: Grafana, Loki, Prometheus

Testing: Jest

Integrations: REST and webhooks for third-party platforms: amoCRM / Kommo, Asana, Google APIs, HH.ru, Avito, SuperJob, Naimix, Telegram Bot API

Also worked with: Kotlin, Ktor (commercial project, 2022–2023)

EXPERIENCE

Backend Engineer (Fullstack) · Rocket.red

January 2024 — present · Remote

- Designed, built and shipped three production systems under enterprise contracts for a large Russian retail / q-commerce client. All three sit on top of a third-party SaaS CRM (amoCRM) and treat its API as an external system. I worked fullstack with a backend focus and now own the roadmap, architecture and performance of all three.

System 1 · Lead deduplication and merging

- Built a configurable merge pipeline that replaced an off-the-shelf marketplace app catching roughly 70% of duplicates. Added business exceptions and merge rules that account for lead source and sales channel; the measured merge success rate rose to about 97% over a month.
- Runs at around 600 requests per minute on average, peaking near 2,000. Designed around the CRM's strict API rate limits with BullMQ queues and Redis caching, plus structured logging for tracing.

System 2 · Shift scheduling platform and embedded time tracker

- Designed and shipped a scheduling platform with a time tracker embedded directly into the CRM's own interface, with no browser extension. Used by 500–700 people a day out of roughly 3,000 connected users; it handles 500–700 shifts a day, and the tracker sustains 250–300 requests per minute during working hours.
- Built the region, group and role model with two-way role sync from the CRM, plus analytics on hours worked, leads handled and slot fill rate.

System 3 · Automated job posting across HH.ru, Avito and SuperJob

- Designed and built a service that publishes and updates job ads on three hiring platforms based on staffing signals from the client's internal system, with automatic rate calculation and per-platform templates. Core logic covered by unit tests in Jest.

Additional work and ownership

- Built a two-way integration between the CRM and Naimix, a contractor management platform: its own backend, its own database, and webhook handling on both sides. Still maintaining and extending it.
- Maintain and extend an integration between the CRM and the client's internal HR system, originally written by another engineer: bug fixes, new features, deal and contact sync logic.
- Wrote the "Webhooks" marketplace app from scratch, then moved to the custom integrations team. Fixed bugs in "Payments" — Rocket.red's flagship app, which pulls payments, per-deal costs and revenue forecasts into a single deal card — and in "Deal Copy with Templates". These apps have over 100,000 installs between them.
- Run code reviews and mentor a junior developer. Was offered a Tech Lead position internally.
- Containerise services with Docker and run them on Kubernetes, maintain GitLab CI/CD pipelines and log aggregation on Grafana, Loki and Prometheus, and own incident response and technical documentation.

Co-founder and Tech Lead · CodeKids.cc — online coding school for children

August 2021 — present · Side business

- Co-founder and operations lead for five years: I coordinate a small team of teachers and run the operational side of the school.
- Sole developer of the production platform: separate portals for parents, students and teachers, a schedule with rescheduling and cancellations, balance tracking, teacher payout requests, and a Telegram bot. Full ownership of architecture, deployment and business logic.
- Stack: NestJS, Vue 3, PostgreSQL, Redis, Telegram Bot API; deployed on Vercel and Railway.

Developer / IT Specialist · Zlatoust City Hospital

December 2022 — December 2023 · Zlatoust, Russia

- As the only developer, designed and built an internal service desk system from scratch (Vue.js, Kotlin/Ktor, MySQL, JWT auth), then rolled it out myself as separate installations across seven municipal institutions in the city and district. Also initiated and prototyped an internal document management system.
- Administered core medical and accounting systems, worked with digital signatures, and maintained the hospital's IT infrastructure: 200+ workstations, Windows and Linux servers, and the building network across seven floors.

EDUCATION

Information Systems and Programming · Zlatoust Industrial College

September 2019 — June 2023 · Graduated with distinction

- Final project: the service desk system later deployed across the city's medical institutions.
- Placed in regional programming competitions (WorldSkills and professional skills olympiads).
- Core coursework: software development, systems analysis, database design, technical documentation, advanced mathematics.
